

# ABSTRACT OF THE DISCLOSURE

A portable information terminal apparatus connected to a recording/reproducing apparatus, including a first generating element for generating a first signal for causing the recording/reproducing apparatus to acquire program information about a program, the generation of the first signal being based on an operation performed by a user, a first transmitting element for transmitting to the recording/reproducing apparatus the first signal generated by the first generating element, second generating element for generating a second signal for causing the recording/reproducing apparatus to display the acquired program information, the generation of the second signal being based on an operation performed by the user, second transmitting element for transmitting to the recording/reproducing apparatus the second signal generated by the second generating element, third generating element for generating a third signal for causing the recording/reproducing apparatus to preset the program for unattended recording, the generation of the third signal being based on an operation performed by the user, and third transmitting element for transmitting to the recording/reproducing apparatus the third signal generated by the third generating element.
